

TOSHIBA CCD IMAGE SENSOR CCD (Charge Coupled Device)

TCD2903D

The TCD2903D is a high sensitive and low dark current 10680 elements×3 line CCD color image sensor which includes CCD drive circuit and clamp circuit. The sensor is designed for scanner.

The device contains a row of 10680 elements × 3 line photodiodes which provide a 48 lines/mm (1200DPI) across a A4 size paper. The device is operated by 5 V pulse, and 12 V power supply.

FEATURES

- Number of Image Sensing Elements : 10680 elements × 3 line
- Image Sensing Element Size : 4 μm by 4 μm on 4 μm centers
- Photo Sensing Region : High sensitive and low dark current PN photodiode
- Distance Between Photodiode Array : 48 μm (12 lines)
- Clock : 2 phase (5 V)
- Power Supply : 12 V Power Supply Voltage
- Internal Circuit : Clamp circuit
- Package : 22 pin CERDIP package
- Color Filter : Red, Green, Blue

MAXIMUM RATINGS (Note 1)

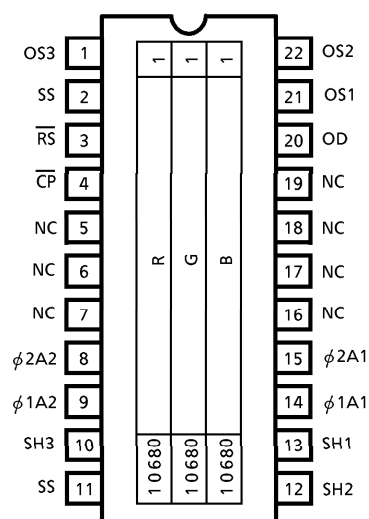

CHARACTERISTIC	SYMBOL	RATING	UNIT
Clock Pulse Voltage	$V_{\phi A}$	- 0.3~8.0	V
Shift Pulse Voltage	V_{SH}		
Reset Pulse Voltage	V_{RS}		
Clamp Pulse Voltage	V_{CP}		
Power Supply Voltage	V_{OD}	- 0.3~15	V
Operating Temperature	T_{opr}	0~60	°C
Storage Temperature	T_{stg}	- 25~85	°C

(Note 1) : All voltage are with respect to SS terminals (Ground).

Weight : 5.2 g (Typ.)

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.

(Note 2) : Sensitivity is defined for each color of signal outputs average when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

(Note 3) : PRNU (1) is defined for each color on a single chip by the expressions below when the photosensitive surface is applied with the light of uniform illumination and uniform color temperature.

$$\text{PRNU (1)} = \frac{\Delta\bar{x}}{\bar{x}} \times 100 (\%)$$

Where \bar{x} is average of total signal output and $\Delta\bar{x}$ is the maximum deviation from \bar{x} . The amount of incident light is shown below.

$$\begin{aligned}\text{Red} &= 1/2 \cdot \text{SE} \\ \text{Green} &= 1/2 \cdot \text{SE} \\ \text{Blue} &= 1/4 \cdot \text{SE}\end{aligned}$$

(Note 4) : PRNU (3) is defined as maximum voltage with next pixels, where measured at 5% of SE (Typ.).

(Note 5) : Register imbalance is defined as follows.

$$\text{RI} = \frac{\sum_{n=1}^{10679} |\bar{x}_n - \bar{x}_{(n+1)}|}{10679 \cdot \bar{x}} \times 100 (\%)$$

(Note 6) : V_{SAT} is defined as minimum saturation output of all effective pixels.

(Note 7) : Definition of SE

$$SE = \frac{V_{SAT}}{R_G} (lx \cdot s)$$

(Note 8) : V_{DRK} is defined as average dark signal voltage of all effective pixels.
 $DSNU$ is defined as different voltage between V_{DRK} and V_{MDK} when V_{MDK} is maximum dark signal voltage.

(Note 9) : DC signal output voltage is defined as follows.
 Reset Noise Voltage is defined as follows.

(Note 10) : Random noise is defined as the standard deviation (sigma) of the output level difference between two adjacent effective pixels under no illumination (i.e. dark conditions) calculated by the following procedure.

- 1) Two adjacent pixels (pixel n and n + 1) in one reading are fixed as measurement points.
- 2) Each of the output level at video output periods averaged over 200ns period to get V (n) and V (n + 1).
- 3) V (n + 1) is subtracted from V (n) to get ΔV .

$$\Delta V = V(n) - V(n + 1)$$

- 4) The standard deviation of ΔV is calculated after procedure 2) and 3) are repeated 30 times (30 readings).

$$\overline{\Delta V} = \frac{1}{30} \sum_{i=1}^{30} |\Delta V_i| \quad \sigma = \sqrt{\frac{1}{30} \sum_{i=1}^{30} (|\Delta V_i| - \overline{\Delta V})^2}$$

- 5) Procedure 2), 3) and 4) are repeated 10 times to get sigma value.
- 6) 10 sigma values are averaged.

$$\overline{\sigma} = \frac{1}{10} \sum_{j=1}^{10} \sigma_j$$

- 7) $\overline{\sigma}$ value calculated using the above procedure is observed $\sqrt{2}$ times larger than that measured relative to the ground level. So we specify random noise as follows.

$$\text{ND } \sigma = \frac{1}{\sqrt{2}} \overline{\sigma}$$

CAUTION**1. Window Glass**

The dust and stain on the glass window of the package degrade optical performance of CCD sensor.

Keep the glass window clean by saturating a cotton swab in alcohol and lightly wiping the surface, and allow the glass to dry, by blowing with filtered dry N₂.

Care should be taken to avoid mechanical or thermal shock because the glass window is easily to damage.

2. Electrostatic Breakdown

Store in shorting clip or in conductive foam to avoid electrostatic breakdown.

3. Incident Light

CCD sensor is sensitive to infrared light.

Note that infrared light component degrades resolution and PRNU of CCD sensor.

4. Lead Frame Forming

Since this package is not strong against mechanical stress, you should not reform the lead frame. We recommend to use a IC-inserter when you assemble to PCB.
